			GENETICS				
1.	Introduction 1min	1min	Meaning	Introducing			
			The term genetics was introduced by Bateson in 1906. It was derived	to topic			
			from Greek word gene'- "to become" or to grow into'. Therefore,				
			Genetics is the science of coming into being				
2.	Define genetics	efine genetics 2	Definition	Defining	Taking		What is
		min	Genetics is that branch of biological sciences which deals with the	genetics	notes		definition of genetics?
			transmission of characteristics from parent to offspring"				genetics:
			Prenatal development begins at the cellular level through a process				
			referred to as fusion when the male germ cell, the sperm, unites with				
			the female germ cell, the ovum to create a new cell referred to as a				
			zygote. The zygote contains the base genetic prototype from which				
			all the remaining cells will develop.				
3.	Discuss about cell division		The developing cellular process is divided into two processes:	Discussing	Discussion		What are
5.			1. Meiosis - cellular divisions occurring prior to fertilization. This	about cell	Discussion		two types of
		3min	process provides for random combinations of genetic materials from	division			cell division?
			each parent through production of haploid germ cells. Haploid germ				

	1		1		
		cells contain half the number of chromosomes found in other body			
		cells.			
		2. Mitosis - cellular divisions occurring after fertilization that create			
		the ongoing growth and development of the organism. This process			
		creates the diploid cells containing a complete chromosome number.			
		The diploid cells are the result of a combination of one maternal X			
		chromosome with one paternal X or Y chromosome to create either			
		an a) XX female or b) XY male.			
Briefly tell					
abutteratogene		TERATOGENESIS	Brief	listerning	
city and some drugs		Teratogenesis refers to the production of defects in the fetus. A	explanation on		What is tertogenecit
ulug3		Teratogenic agent is responsible for producing such a defect. The	teratogenecit		y?
		term teratogen usually is cited in the context of causing anatomical	У		
		defects in an embryo that was previously differentiating normally.			
		The time during embryogenesis when the fetus is exposed to a			
		potential Teratogens is crucia. The capability of formation of			
		congenital anomalies in fetus is known as teratogenicity			
		Teratogens include radiation, chemicals (drugs), Stressors,			
		malnutrition and infectious agents. This chapter reviews principles of			
		teratology and discusses drug use in pregnancy.			
		Harmful substances such as drugs or radiation that invade the womb			
		and result in birth defects are called Teratogens. Teratogens are			
		especially damaging in the embryonic stage because it is a critical			
		period in prenatal development. Later, during the fetal stage, the			
		environment provided by the mother affects the baby's size, behavior,			

4.

affect many organ systems. Some organ systems are preferentially		
affected, but the pattern of anomalies also reflects the organ systems		
differentiating at the time the agent was administered. For example,		
administering thalidomide between days 35 and 37 causes ear		
malformations administering the agent between days 41 and 44		
causes amelia or phocomelia		
Dosage		
Although high doses of a proven teratogen usually are more		
deleterious than low doses, this is not always true. At any given time,		
an embryo can respond to a teratogen in one of three ways: (1) at a		
low dose, there is no effect: 2) at an intermediate dose, a pattern of		
organ-specific malformations can result; and (3) at a high dose, the		
embryo may be killed, causing the organ-specific teratogenic action		
to go unrecognized.		
Timing		
The effect of a teratogen on the developing organism depends on		
what period in the pregnancy (in development) the child is exposed to		
the teratogen. some teratogens cause damage only during specific		
days of weeks in early pregnancy other teratogens are harmful at any		
time during the pregnancyfor example, for behavioral teratogens.		
There is no safe periodthe brain and nervous system can be harmed		
throughout the pregnancy.		
Genotype		
The genotype of the mother and the fetus influences the efficacy of a		
teratogen. For example, genotype determines the prevalence of cleft		

	1		1	1	1
		palate in inbred strains of mice whose mothers are administered			
		cortisol during pregnancy.			
		Drug Interactions			
		Simultaneous administration of two(Drugs) teratogens may produce			
		a different effect from that existing when the two are administered			
		separately			
		Other Factors			
	Introduction on genetic counseling	Variability in teratogenic response sometimes is associated with other			
		environmental or morphologic factors: maternal or fetal weight, in			
		utero position of the fetus, proximity to other affected litter mates,	Introducing		
5.		uterine vasculature, and diet.	topic on genentic	listening	
			counseling	listening	
		GENETIC COUNSELING			
		INTRODUCTION:			
		Rapid expansion in the identification, understanding and			
		diagnosis of genetic disease has been accompanied by effective			
		medical and surgical therapies in a small number of cases. For the			
		majority of genetic conditions, therapeutic or preventive measures are			
		nonexistent or disappointed limited. Consequently, the most useful			
		means of reducing the incidence of these disorders is by preventing			
	Define genetic	their transmission. With the accumulation of knowledge about			
	counseling	genetic disorders, the probability of recurrence can be predicted with			
6.		increased accuracy. At present the best means for reducing the	Defining		
		number of children born with genetic defects is for health	genentic	Taking	What is
		professionals to provide families with genetic information and	counseling	notes	genetic
					counseling?

		services.			
		DEFINITION:			
	Explain	Genetic counseling can be defined as a process of			
	screening	communication and education that addresses concerns relation to the			
	methods	development and or transmissions of hereditary disorders.			
7.		The different etiologic factors for fetal malformations are:	Explaining	Asking	
		1. Chromosomal abnormalities (numeric or structural)	the screening methods	doubts	What are
		2. Single gene disorders (cystic fibrosis)—1%			the
		3. Polygenic or multi factorial disorders			screening methods?
		4.Teratogenic disorders due to exposure of exogenous factors (drugs).			
		SCREENING METHOD			
		First Trimester Screening			
		Screening parameters are:			
		(A) Biophysical: (i) ultrasound measurement of nuchal translucency			
		(NT),			
		(ii) Nasal bone,			
		(B) Biochemical: (i) free β -hCG, (ii) PAPP-A (Pregnancy Associated			
		Plasma Protein-A).			
		Time of Test: Between 11 weeks and 14 weeks.			
		Values: PAPP-A—reduced; β -hCG—increased; NT—measurement			
		increased in trisomy 21.			
		Second Trimester Screening:			
		It is done between 15 weeks and 22 weeks.			

			1			
		MSAFP: This test is done between 15 weeks and 20 weeks. MSAFP				
		value of 2.5 multiples of the median (MOM) when adjusted with				
		maternal weight and ethnicity is taken as cut-off point. Elevated				
		MSAFP detects 85% of all neural tube defects. Cases with such high				
		values are considered for high resolution				
		ultrasound imaging and/or amniocentesis. Very low MSAFP levels				
		are associated with increased rates of miscarriage, stillbirth and				
		neonatal death.				
	Isllustrate the	Triple Test: It is a combined biochemical test which includes		Taking notes		
	four	MSAFP, hCG and uE3 (unconjugated estriol).	Illustrating the			
	biochemical screening.	Maternal age in relation to confirmed gestation age is also taken into				
8.		account. It is used for detection of Down's syndrome. In an affected				
		pregnancy, levels of MSAFP and uE3 tend to be low while that of	fourbiochemi cal screening			Write the four biochemical screening?
		hCG is high. It is performed at 15–22 weeks. It gives a risk ratio and				
		for confirmation CVS/amniocentesis has				
		to be done. The result is considered to be screen positive if the risk				
		ratio is 1:250 or greater.				
		Quadruple (Quad) Screening includes four biochemical analytes:				
		(1) Maternal Serum Alpha Fetoprotein (MSAFP),				
		(2) Unconjugated estriol (uE3),				
		(3) dimericinhibin-A and (4) hCG.				
		Quadscreen can detect trisomy 21 in 85% of cases with a false-				
		positive rate of 0.9%. Levels of serum analytes in cases with trisomy				
		21: hCG—increased; uE3—reduced; inhibin A—elevated; MSAFP—				

	-						1	
		reduced.

		disease.	steps of genetic		What are
		2. Retrospective genetic counseling: there is a way a history of	counseling		the steps in
		either an offspring or relative being affected. At present this			genetic counseling?
		counseling is mostly using and this is the hereditary disorder			
		has already occurred in the family.			
		3. Expanded family genetic counseling: usually given in			
		chromosomal abbreations occurring secondary to balanced			
		translocation or inversion and in x-linked condition.			
	List out pursos				
	List out nurses role in genentic	STEPS OF GENETIC COUNSELING:			
	counseling	1. Diagnosis: the goal evaluation is to make a diagnosis of			
		particular condition or syndrome			
		2. Prognosis: the next step after diagnosis is for a family to			
14.		understand about the disease. The genetic counselor will	Listing out	Taking	
		explain how the condition has affected other people with	the nurses	notes	
		same diagnosis. What kind of symptoms or problems may	role in genetic		What are the nursing
		faced by the family.	counseling		role?
		3. Treatment: all the available treatment for genetic disease			

are explained and recommended.

- **4. Inheritance and recurrence risks**: the genetic or the genetic counselor will be able to answer the questions of family member bout chances of passing this conditions.
- **5. Genetic testing:** genetic counselor explains ad recommend various testing for the couples affected with genetic disorder.

NURSES ROLE IN GENETIC COUNSELING:

Preparation for Counseling

The initial interview or intake visit is often conducted ducted by a nurse. At this time a detailed family history is obtained including information about the social aspects and the meaning that disorder has for this particular person or family. The family is told what to expect during counseling process, procedures to be performed, and the personnel with whom they will be involved. The interview serves as an opportunity to assess the client's or family's needs and reduce anxiety. Most people who come for genetic counseling are nervous and apprehensive because they are not only concerned about a genetic condition but also know that the outcome of the counseling and the decisions made may significantly alter their lives, Therefore, a distraction-free atmosphere should be provided. This may require care for small children whose restlessness and behavior can divert attention from what is being said. An ample amount of time is allotted to provide the family with as much information as possible.

- Preconception counseling: ideally couples that have the potential to transfer genetic disorder to their offspring should be counseled before pregnancy occurs. When the preconception counseling is possible, the nurse should have a relaxed interview with the couples to discuss the issues related risk.
- Prenatal counseling: In prenatal counseling the nurse has to identify women or couples who are at risk or having the potentials for congenital disorder in their offspring.
- Follow up care: maintaining follow up care with the family after genetic counseling or therapy is one of the most important nurse responsibilities.
